Fitch Ratings

Steel Demand Recovery to Continue in Most Markets in 2024 Excluding China

We expect European steel demand to recover in 2024 following weak performance in 2023. Utilisation rates have been below 60% in 2023, according to CRU, after high interest rates took their toll on the construction sector, while geopolitical conflicts and high energy prices have resulted in weak economic growth. Improving demand will be supported by automotive, industrial production and infrastructure spending amid an easing of inflation and energy costs. Margins will also improve in 2024 from the trough of 2023 as cost pressures subside and production increases.
